

The Whale stranding and dinosaurs' extinction.

Why whales are stranding on beaches across the oceans, and kill themselves, is a question to which none of those who study their way of life could not give an answer. By converting solar energy into matter on earth, it increases the weight of our planet (geological layers,) and its gravity. This makes difficulties to bulky whales, and their maintain, and constantly swimming in the water. Fatigue, due to weakening hearts, and the increasing force of gravity, forces each of them to seek rest on the sandy beaches across the oceans. Stranded, rested, alone, whales are not possible to return to oceans. Because of the same reason, from dinosaurs survived only birds, creeper's reptiles, and crocodiles, which could take rest on the solid ground.

By the way, dinosaurs were not killed by a meteor. Stupidity! They were eaten by rodents. They disappeared with their appearance on earth. They were in a difficult situation. Difficult to move, inert, and incapable to endure to gravity they could not endure rodent infestation.
