

The Earth Warming and A Possibility of A New Ice Age The Scientific's information. (Contemplation.)

Dr. and Mr. sc. MD Ante Rilović, retired surgeon.

The influence of oceans on the continental climate does not need to discuss.

The melting the Arctic and the Antarctic ice are lowering temperatures of the surrounding oceans.

Results are extreme differences between the temperatures of cyclones and anticyclones.

How the July and August isotherms of the coastal areas of Iceland, Greenland, Norway and Russia, and the east's coasts of the North America, are ranging between 5,0 and 10, 0, and more degrees of Celsius, lowering their temperature, due to the melting of the Arctic ice, can cause, lowering their temperature to the freezing point of the 0 degrees of Celsius, the first in the most Easter's coasts of Siberia.

In for it the favorable circumstances (volcano's eruptions, big forest's fires, etc.) this can cause the re-icing of the Arctic Ocean, and the North's parts of the North Atlantic, what could cause ensuing the new ice age?

Possibility of cyclical occurrence of this phenomenon, it is necessary to think about it, and in the endangered areas take the necessary measures for the peaceful care of the population, possible. its relocation from it the most dangerous areas.
