**Abstract :** For two given graphs  $G$  and  $H$ , the Ramsey number  $R(G,H)$  is the positive integer  $N$  such that for every graph  $F$  of order  $N$ , either  $F$  contains  $G$  as a subgraph. The Ramsey number  $R(F_1, K_4)$  where  $F_1$  is the graph of every triangle. The aim of this paper is to prove that  $R(F_1, K_n) = 2l(n-1) + 1$  for  $n=4$  &  $l = 3$  and  $R(F_1, K_n) = 2l(n-1) + 1$  for  $l \geq n \geq 5$ .

**Keywords:** Fan, Graph, Ramsey number, Tree, Wheel.

### I. Introduction

A complete graph is a graph with an edge between every pair of vertices. A tree is a connected graph  $T$  that does not contain any cycles. The complete graph on  $n$  vertices is denoted by  $K_n$ . The graph  $\square$  is the compliment of  $G$  which is obtained from the complete graph on  $|V(G)|$  vertices by deleting the edges of  $G$ . A graph  $G$  is complete  $p$ - partite if its vertices can be partitioned into  $p$  non empty independent sets  $V_1, V_2, V_3, V_4, \dots, V_p$  such that its edge set  $E$  is formed by all edges that have one end vertex in  $V_i$  and the other one in  $V_j$  for  $1 \leq i < j \leq p$ . A complete 2-partite graph is called a complete  $m$  by  $n$  bipartite graph and denoted by  $K_{m,n}$  if  $|V_1| = m$  and  $|V_2| = n$ . A star  $S_n$  is a complete 2-partite graph with independent sets  $V_1 = \{r\}$  and  $V_2 = n$ . the vertex  $r$  is called the root and the vertices in  $V_2$  are called the leaves of  $S_n$ . A wheel  $W_m$  is a graph on  $m+1$  vertices obtained from a cycle on  $m$  vertices by adding a new vertex and edges joining it to all the vertices of the cycle ( $W_m$  is the join of  $K_1$  and  $C_m$ ). A kipas  $\square_m$  is a graph on  $m+1$  vertices obtained from the join of  $K_1$  and  $P_m$ . A fan  $F_m$  is a graph on  $2m+1$  vertices obtained from  $m$  disjoint triangles ( $K_3$ s) by identifying precisely one vertex of every triangle ( $F_m$  is the join of  $K_1$  and  $mK_2$ ).

Let  $V(G)$  is the vertex set and  $E(G)$  is the edge set for the graph  $G=(V(G),E(G))$  and  $\square$  is the compliment of  $G$ .  $G(S)$  denotes the subgraph for  $S \subseteq V(G)$ , induced by  $S$  in  $G$  and  $G-S = G[V(G) - S]$ .  $N_s(V)$  is the set of neighbours of vertex  $V$  in  $S$  and  $d_s(V) = |N_s(V)|$ . when  $S = V(G)$ , then  $N_v = N_G(V)$ ,  $N_{[V]} = N_{(v)} \cup \{V\}$  and  $d(V) = d_G(V)$ . let the graph of order  $n$  is  $k_n$  and  $mk_n$  is the union of  $m$  vertex.  $F_\square$  is the fan of order  $(2\square + 1)$  and the join of  $k_1$  and  $\square k_2$ , which is  $\square$  triangles sharing exactly one vertex. Where  $k_1$  is the center of  $F_1$ . The Ramsey number  $R(F,H)$  is the simplest integer for two given graphs  $F$  and  $H$  such that for any graph  $G$  of order  $N$ , either the compliment of  $G$  contains  $H$  or  $G$  contains  $F$ . Burr[1] formulated a lower bound for a connected graph  $F$  of the order  $P$ , that is  $R(F,H) \geq (P-1)(X(H)-1) + S(H)$ , if  $P \geq S(H)$ , where  $X(H)$  is the chromatic number of  $H$  and the minimum count of vertices in class under vertex coloring is  $S(H)$  by  $X(H)$  colors. Noting that  $X(K_n) = n$  and  $S(K_n) = 1$  for the pair  $F_1$  and  $K_n$ .

By Burr's lower bound,  $R(F_\square, K_n) \geq 2\square(n-1) + 1$ . For  $n=3$ , Gupta [2] showed that  $R(F_\square, K_3) = 4\square + 1$  for  $\square \geq 2$

For  $n=4$ , Surahmat [3] showed that  $R(F_\square, K_4) = 6\square + 1$  for  $\square \geq 3$

The conjecture for  $n=5$  is to be confined in this paper.

$G$  is a graph of order  $8\square + 1$ ,  $\square \geq 5$ , let us show that  $G$  contains an  $F_\square$  or  $\square$  contains  $K_5$ . let us assume that  $G$  does not contain an  $F_\square$  or  $\square$  does not contains  $K_5$ . Let  $v \in V(G)$ ,  $d(v) \leq 2\square - 1$  then  $G - N[v]$  is a graph of order at least  $6\square + 1$  for  $\square \geq 3$ ,  $\square - N[v]$  contains a  $k_4$ , it means that  $\square$  contains a  $k_5$  which is a contradiction. If  $d[v] \geq 2\square + 3$ , then the maximum matching  $M$  of  $G[N(v)]$  contains at least  $\square$  edges for otherwise  $\square[N(v) - V(M)]$  will be a complete graph of order  $S$ , which means that  $G$  has an  $F_\square$  which is-a contradiction. So,  $2\square \leq d(v) \leq 2\square + 2$ .

Let us assume  $G$  contains a sub graph  $H=K_{2\square-1}$ . Let  $V_0 \in V(G) - V(H)$  such that  $d_H(V_0) = \max \{d_H(v)/v \in V(G) - V(H)\}$ . Then  $G - (V(H) \cup \{V_0\})$  is a graph of order  $6\square + 1$ .

As  $\square$  has no  $K_5$ ,

$V(H) \cup \{V_0\} \leq \bigcup_{i=1}^4 N(U_i)$

It means that  $\max \{d_H(V_i) / 1 \leq i \leq 4\} \geq \lfloor (2\square - 1) / 4 \rfloor \geq 3$ .

If  $d_H(V_0) \geq 4$ , the  $V_i$  has two adjacent values in  $N_H(V_0) \cup \{V_0\}$ ,

If  $d_H(V_0) = 3$ , then  $d_H(V_i) \leq d_H(V_0) = 3$  for  $1 \leq i \leq 4$ , which means that  $d_H(V_i) \geq 2$  and  $N_H(V_i) \cap N_H(V_0) \neq \emptyset$ . In either cases,  $G[V(H) \cup \{V_0, V_i\}]$  contains an  $F_{\square}$ , a contradiction. So  $G$  does not contain  $K_{2\square-1}$ .

For  $1 \leq i \leq 4$ , set  $X_i = \{V \mid d_v(v) = 1, V \in V(G)\}$

$$\sum_{i=1}^4 |X_i| = 8\square - 3$$

$$\sum_{i=1}^4 i |X_i| = \sum_{i=1}^4 d(U_i)$$

$$|X_i| \geq 8\square - 14 + |X_3| + 2|X_4| \geq 8\square - 14.$$

$$X_{1i} = N_{X_1}(V_i), 1 \leq i \leq 4$$

As  $\square$  has no  $K_5$ ,  $G[X_{1i} \cup \{U_i\}]$  is a complete graph.

And as  $G$  has no  $K_{2\square-1}$ ,  $|X_{1i} \cup \{U_i\}| \leq 2\square - 2$  which means  $|X_{1i}| \leq 2\square - 3$  for  $1 \leq i \leq 4$ .

Hence  $|X_{1i}| = \sum_{i=1}^4 |X_i| = 8\square - 12$  and  $|X_3| + 2|X_4| \leq 2$   
So  $|X_2| \geq 7$ .

As  $G$  contains no  $K_{2\square-1}$ ,  $U_i - N_{(y)} \neq \emptyset$ . Then  $G[U_i \cup U_j - N_{(y)}]$  is a complete graph.

$G$  has no  $F_{\square}$ ,  $V_i$  and  $U_j$  are complete graphs. And  $d_{U_j}(U) \leq 3$  for any  $U \in V_i$ , Such that  $|V_j| \geq 2\square - 4$  and  $\square \geq 5$ .  $dV_j(y) \geq |U_j|$ ,  $|U_j - N_{(y)}| \geq (2\square - 4) - 3 \geq 3$ .

Where  $U_j$  is pair wise vertex-disjoint.

If  $|U_4| = 2\square - 2$ , then  $X_2 = U_1 \leq i \leq j \leq 4$  and  $Y_{ij} = \emptyset$  which contradicts  $|X_2| \geq 7$ .  
So,  $2\square - 4 \leq |U_4| \leq 2\square - 3$ .

$$|U_3| + |U_4| \geq 4\square - 6 \text{ and } |U_4| \leq 2\square - 3$$

$$\sum_{i=1}^4 d(U_i) = 8\square + 8, d_{X_2}(U_4) = 6$$

Assume  $N_{X_2}(U_4) = \{y_i \mid 1 \leq i \leq 6\}$  and  $\square$  contains no  $K_5$ ,  $G\{N_{X_2}(U_4)\}$  contains at least one edge.

$$Y_1, Y_2 \in E(G)$$

And as  $G$  has no  $F_{\square}$ ,  $G[\{y_3, y_4, y_5, y_6\}]$  contains no edge. As  $\square$  has no  $K_5$ ,

$$|\{y_3, y_4, y_5, y_6\} \cap (N(U_1) \cup N(U_2))| \geq 2$$

Let us assume  $\{y_3, y_4\} \subseteq N(U_1) \cup N(U_2)$

$$d_{U_4}(y_3) \geq 3 \text{ and } d_{U_4}(y_4) \geq 3,$$

which means that  $d_{X_{14}}(y_3) \geq 2$  and  $d_{X_{14}}(y_4) \geq 2$

This shows that there exists  $U'$  and  $U \in X_{14}$  such that  $U'y_3, U''y_4 \in E(G)$  and shows that  $G[U_4 \cup \{y_1, y_2, y_3, y_4\}]$  has an  $F_{\square}$  having  $U_4$  as center, which is a contradiction.

This proves that  $R(F_{\square}, K_5) = 8\square + 1$  for  $\square \geq 5$ .
