

Design of Movie Theatre by STAADD Pro Analysis and LSM - A Study

P.Yella Reddy¹ and B.Rama Bhupal Reddy²

¹ Research Scholar, Department of Mathematics, Rayalaseema University, Kurnool, A.P.

² Associate Professor, Department of Mathematics, K.S.R.M College of Engineering (Autonomous), Kadapa, A.P.

Abstract: The design of a modern movie theatre is very complicated and it should be done very methodically keeping in mind the innumerable number of details that it should be attended to. A certain degree of price discrimination can be seen at movie theatres. There is a different and varied price not only for when but also for where one sits in a movie theatre. This is to say that one is charged more for the same movie and the same experience based on from where he or she sits. As by norm, the seats in front are charged lesser than the seats at the back. The comfort of viewing, i.e. physical comfort is the best at the back, and worst in the front, but the last few 'expensive' rows may not be the most 'ideal' place to watch the movie from. In this paper includes the design of an ideal movie theatre such that one can have the best possible angle of vision using STAADD PRO ANALYSIS and LSM

Keywords: Movie theatre, Beams, Purlins, Footing, STAADD PRO ANALYSIS, LSM.

I. Introduction

Cinema is most popular and cheapest entertainment for the people. For screening the movies to the audience a fully fledged movie theatre is necessary. Hence, though the movie theatre is a commercial entertainment structure, it should provide maximum facilities and comforts to the audience at a reasonable prize. The designer will need many and varied skills – drawing, painting, construction, draftsman-ship, sewing, budgeting, self promotion, communication, are all skills which are needed in various degrees. The designer also needs to have an understanding of the text and of the human figure in space. So the following four principles are Theatre design can be a lifetime study.

- The audience must feel closely linked with the performers and each other
- The audience should be clustered around the performers, within the limits of good sightlines
- The auditorium must be scaled to sustain and enhance the performance.
- The architecture should encourage a sense of excitement and community

II. Structure of a Movie Theatre

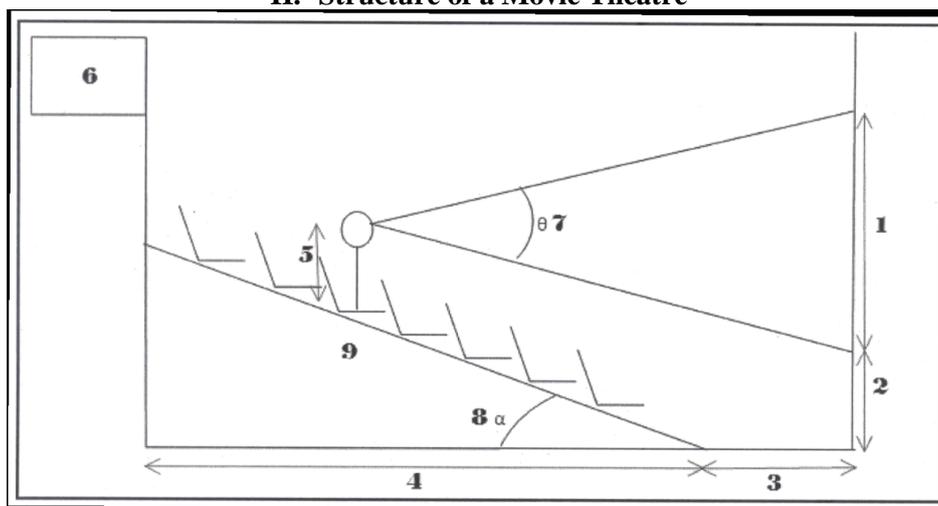

Fig 1. A simplified drawing of movie theatre

The above figure is a drawing representation of a movie theatre which depicts the following:

1. THE SCREEN
2. HEIGHT OF THE SCREEN ABOVE THE GROUND

3. DISTANCE BETWEEN SCREEN AND FIRST ROW
4. HORIZONTAL DISTANCE BETWEEN FIRST ROW AND THE END OF SEATING AREA
5. THE HEIGHT OF THE INDIVIDUAL
6. PROJECTOR ROOM
7. θ -THE ANGLE SUBTENDED BY SCREEN ON INDIVIDUALS EYE
8. α - THE ANGLE OF INCLINATION OF THE SEATING AREA
9. THE SEATING

III. Room Design And Acoustics

The shape of the room is one of the important factors affecting its acoustical properties. Hence the determination of most desirable shape is a problem that the architect should know how to solve. The optimum ratio of length to width for a room is not a fixed number, but varies with the size and shape of the seating area. For most rooms, ratio of the length to width between 1.2:1 and 2:1 has been more satisfactory.

IV. Design of Theatre

Length of 4 seats = 2.54 m , wall thickness= 0.23 m

Let us provide 25 rows each having 24 seats , 12 each on either side of ramp 2m wide.

Total length occupied by 12 seats = $3 \times 2.54 = 7.62$ m

Allow passage of 1 m at the end of seating on both sides.

Total internal breadth of theatre= $1 + 7.62 + 2 + 7.62 + 1 = 19.24$ m

External breadth = $19.24 + 2 \times 0.23 = 19.7$ m

From the above data,

- a) Screen dimensions = 13m * 5.5m
- b) Height of screen above the ground= 3 m
- c) Distance between screen and first row = 8 m
- d) Distance between first row and last row:

Provide 3 classes with landings of 1.5 m between each class.

Class A = 8 rows, Class B = 8 rows, Class C = 9 rows

Width of each row= 1 m

Distance between 1st and last rows = $9 + 1.5 + 8 + 1.5 + 8 = 28$ m

Total length of theatre = $8 + 28 = 36$ m

Aspect ratio = $36 / 19.24 = 1.87 < 2$

Therefore acoustic dimensions are satisfied.

- e) Let angle of inclination of seating area = 9°

The inclination starts at a distance of 7.8 m from the screen.

Height of last row from the floor near screen = 4.04 m

Total height of columns = $3 + 5.5 + 0.5 = 9$ m

As the breadth of theatre is 19.24 m it will be difficult to provide beams. So roof truss should be designed for this theatre.

V. Staad Analysis – Determination of Forces In Truss Members

VII. Calculations For Truss

Clear span of the truss=19.24m
 Assume a bearing of 20cm on either side
 Effective span=19.24+0.2+0.2=19.64m
 According to hand book based on IS codes,
Dead load/m²
 1. Galvanian sheeting =16Kg/m²
 2. Purlins (6 to 9 kg/m²) =8Kg/m²
 3. Truss weight (10 to 14kg/m²) =12 Kg/m²
 4. Weight of wind bracings =1.3Kg/m²
 =**37.3Kg/m²** =**375N/m²**

Adopting c/c of truss=4m , Let pitch=1 in 4
 Load/Panel= $w \cdot l/8 = \frac{375 \cdot 4 \cdot 19.64}{8} = 367 \text{KN}$

Live Load:
 As per IS-875, For roof sloping >10°, LL=75Kg/m²-(1 Kg/m² for 1° increase in slope)
 >20°, LL=75 Kg/m²-(2 Kg/m² for 1° increase on slope) ,Up to minimum of 40 kg/m²
 Rise of span=19.64/4=4.91m
 Slope of truss=tan⁻¹(4.91/9.82) =26.565°
 LL=75-(6.565*2)-(10*1) =52Kg/m²=520 KN/m²

Wind load:
 Basic wind pressure at Anantapur, P=100Kg/m²

1. External wind pressure as per IS-875

	Wind ward slope	Leeward slope
20°	-0.4P	-0.5P
26.565°	-0.218P (interpolation)	-0.5P
30°	-0.1P	-0.5P

2. **Internal wind pressure:-** Assuming normal permeability, internal wind pressure = $\pm 0.2P$
 3. **Total wind pressure:**

WIND PRESSURE	WIND WARD SIDE	LEE WARD SIDE
a) External	$-0.218P = 218 \text{ Kg/m}^2$	$-0.5P = -50 \text{ Kg/m}^2$
b) External + Internal(-0.2P)	$(-0.218-0.2)P = -41.8 \text{ Kg/m}^2$	$(-0.5-0.2)P = -70 \text{ Kg/m}^2$
c) External + Internal(+0.2P)	$(-0.218+0.2)P = -1.8 \text{ Kg/m}^2$	$(-0.5+0.2)P = -30 \text{ Kg/m}^2$

Maximum is in case (b)
 Diagonal length of truss = $\sqrt{9.82^2 + 4.91^2} = 10.98\text{m}$
 Length of each panel = $10.98/4 = 2.745\text{m}$
 Spacing of trusses = 4 m c/c
LOAD PER PANEL:
 Due to DL = 366.3 Kg
 LL = $52*4*2.455 = 510.64 \text{ Kg}$
 Wind load a) wind ward side = $-42*4*2.745 = -461 \text{ Kg}$
 b) lee ward side = $-70*4*2.745 = -769 \text{ Kg}$

VIII. Design of Truss

DESIGN OF TOP CHORD (COMPRESSION MEMBER):

Maximum load = 185.61 KN
 Factored load = $1.5*185.61 = 278.415 \text{ KN}$
 Length = 2.745 m
 Let us assume effective slenderness ratio to be 100
 For tubular section, for the buckling curve b, the design compressive stress corresponding to effective slenderness ratio 100 is 118 N/mm^2
 Therefore Area = $(278.415*10^3/118) = 2355.9 \text{ mm}^2$
 From IS handbook (or) from S.K Duggal, pg 786, try steel tube of 160 mm Nominal bore and heavy section of 5.4 mm thickness
 $A = 2760\text{mm}^2, Z=109\text{cm}^2, R=5.76 \text{ cm}$
 Effective slenderness ratio = $\frac{2.745*1000}{57.6} = 47.65 < 180$ [SAFE]
 For $\lambda = 47.65; f_y = 250\text{N/mm}^2$ and buckling curve 'b' the design compressive stress from table 7.6.
 $F_{cd} = 186.5\text{N/mm}^2$
 Design compressive load $P_d = A_c * f_{cd} = 2700*186.5$
 $= 514.74 \text{ KN} > 278.415 \text{ KN}$ [SAFE]

Hence provide steel tube of 160 mm nominal bore and heavy section of 5.4 mm thickness

DESIGN OF WELDING:-

a) Design strength of weld in tension { $l_w = \pi d = 500\text{m}$ }
 $T_{dw} = \frac{f_y l_w t_e}{\gamma_{mw}} = \frac{250*500*((5/8)*5.4)}{1.25} = 506.25\text{KN} > 278.415\text{KN}$ [SAFE]
 b) Design strength of weld in compression
 $V_{dw} = \frac{(410/\sqrt{3})*500*((5/8)*5.4)}{1.25} = 319.563 \text{ KN} > 278.415 \text{ KN}$ [SAFE]

DESIGN OF TRUSS MEMBERS (COMPRESSION MEMBER):

Maximum load = 52.5 KN
 Factored load = $1.5*52.5 = 78.75 \text{ KN}$
 Length = 4.5 m
 Let us assume effective slenderness ratio to be 100
 For tubular section, for the buckling curve b, the design compressive stress corresponding to effective slenderness ratio 100 is 118 N/mm^2
 Therefore Area = $(78.75*10^3/118) = 667.4 \text{ mm}^2$
 From IS handbook pg 786, try steel tube of 90 mm Nominal bore and light section of 3.6 mm thickness
 $A = 1110\text{mm}^2, Z=26.2\text{cm}^2, R=3.47 \text{ cm}$
 Effective slenderness ratio = $\frac{4.5*1000}{34.7} = 130 < 180$ [SAFE]
 For $\lambda = 130; f_y = 250\text{N/mm}^2$ and buckling curve 'b' the design compressive stress from table 7.6.
 $F_{cd} = 88.3 \text{ N/mm}^2$
 Design compressive load $P_d = A_c f_{cd} = 1110*88.3 = 98.013 \text{ KN} > 78.75 \text{ KN}$ [SAFE]

Hence provide steel tube of 90 mm nominal bore and light section of 3.6 mm thickness

DESIGN OF WELDING

a) Design strength of weld in tension { $l_w = nd = 283m$ }
 $T_{dw} = \frac{250 \cdot 283 \cdot ((5/8) \cdot 3.6)}{1.25} = 159.043 \text{ KN} > 78.75 \text{ KN} \quad [\text{SAFE}]$

b) Design strength of weld in compression
 $V_{dw} = \frac{(410/\sqrt{3}) \cdot 283 \cdot ((5/8) \cdot 3.6)}{1.25} = 120.6 \text{ KN} > 78.75 \text{ KN} \quad [\text{SAFE}]$

DESIGN OF TRUSS MEMBERS (COMPRESSION MEMBER):

Maximum load = 88.62 KN

Factored load = $1.5 \cdot 88.62 = 132.3 \text{ KN}$

Length = 4.91 m

Area = $T \cdot Y_{mo} / f_y = (132.3 \cdot 10^3 \cdot 1.1 / 250) = 582.12 \text{ mm}^2$

From IS handbook (or) from S.K Duggal, pg 786, try steel tube of 65 mm Nominal bore and medium section of 3.6 mm thickness

Area provided = 820 mm^2 , $Z = 14.2 \text{ cm}^2$, $R = 2.57 \text{ cm}$

IX. Check For Gross Section Yielding

$A = T \cdot Y_{m1} / f_y \Rightarrow 820 = T \cdot 1.1 / 250 \Rightarrow T = 186.36 \text{ KN} > 132.3 \text{ KN} \quad [\text{SAFE}]$

CHECK FOR NET SECTION RUPTURE:

$T_{dn} = A_n \cdot f_u / Y_{m1} = 820 \cdot 410 / 1.25 = 268.9 \text{ KN} > 132.3 \text{ KN} \quad [\text{SAFE}]$

Hence provide steel tube of 65 mm nominal bore and heavy section of 3.6 mm thickness

DESIGN OF WELDING:

a) Design strength of weld in tension { $l_w = nd = 204.2m$ }
 $T_{dw} = \frac{250 \cdot 204.2 \cdot ((5/8) \cdot 6)}{1.25} = 153 \text{ KN} > 132.3 \text{ KN} \quad [\text{SAFE}]$

b) Design strength of butt weld in shear
 $V_{dw} = \frac{(410/\sqrt{3}) \cdot 204.2 \cdot ((5/8) \cdot 6)}{1.25} = 145 \text{ KN} > 132.3 \text{ KN} \quad [\text{SAFE}]$

DETAILS OF TRUSS:

NOMINAL BORE (mm)	CLASS	THICKNESS (mm)	WEIGHT (kg/m)	AREA OF C/S (cm ²)	Z (cm ³)	R (cm)	WELD (mm)
160	Heavy	5.4	21.200	27.10	109.0	5.76	3.375
90	Light	3.6	8.760	11.10	26.20	3.47	2.25
65	Medium	3.6	6.490	8.20	14.20	2.57	3.75

X. Design of Purlin

Since the slope of roof truss is less than 30° , tubular section can be used as purlin. According to hand book based on IS codes .

DEAD LOAD:

Galvanian sheeting = 16 Kg/m^2
 Purlins = 8 Kg/m^2
 24 Kg/m^2

Total DL = $24 \cdot 2.455 \cdot 4 = 235.68 \text{ Kg} = 2360 \text{ N}$

LIVE LOAD:

Live load as calculated earlier = 520 N/ m^2
 Total LL = $520 \cdot 2.455 \cdot 4 = 5106.4 \text{ N}$

WIND LOAD:

Wind load normal to roof truss = 1500 N/ m^2
 Total wind load = $1500 \cdot 2.745 \cdot 4 = 16470 \text{ N}$

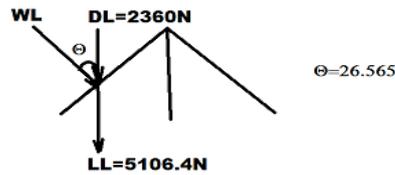

Fig 2: Purlins

TOTAL LOAD = $16470 + (2360 + 5106.4)\cos 26.565^\circ = 23150 \text{ N} = 23.15 \text{ KN}$
 Maximum Bending Moment = $w \cdot l / 10 = 23.15 \cdot 4 / 10 = 9.26 \text{ KNm}$

SECTION MODULUS:

$$Z = M / (1.33 \cdot 0.66 \cdot f_y) = 9.26 \cdot 10^6 / (1.33 \cdot 0.66 \cdot 415) = 25.419 \text{ cm}^3$$

Provide medium tubular section of 90 mm nominal bore having thickness of 4mm whose sectional modulus $Z = 28.8 \text{ cm}^3$

BOLT CONNECTIONS:

Use 2- 16 mm diameter bolts, $A_{nb} = 2 \cdot 0.785 \cdot \pi \cdot 16^2 / 4 = 315.66 \text{ mm}^2$

Strength of bolt in single shear = $V_{sb} = 315.66 \cdot 400 / \sqrt{3} \cdot 1.25 = 58.308 \text{ KN} > 23.15 \text{ KN}$ [SAFE]

Strength of bolt in bearing = $2.5 \cdot 0.5 \cdot (2 \cdot 16) \cdot 4 \cdot 400 \cdot 10^{-3} / 1.25 = 51.2 \text{ KN} > 23.15 \text{ KN}$ [SAFE]

XI. Analysis And Design of Frames

X-AXIS:

Loading area = $2 \cdot (\frac{1}{2} \cdot (5+1) \cdot 2) = 12 \text{ m}^2$

Slab load = $12 \cdot ((0.15 \cdot 25) + 2) = 69 \text{ KN}$

Load on beam = $69 / 5 = 13.8 \text{ KN/m}$

Self-weight of beam = $0.23 \cdot 0.6 \cdot 25 = 3.45 \text{ KN/m}$

Total load = $13.8 + 3.45 = 17.25 \text{ KN/m}$

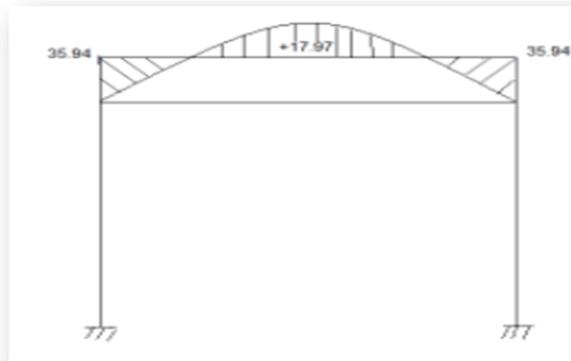

Fig 3 : bmd in X - axis

Y- AXIS:

Loading area = $2 \cdot (\frac{1}{2} \cdot (5+1) \cdot 2) = 12 \text{ m}^2$

Slab load = $12 \cdot ((0.15 \cdot 25) + 2) = 69 \text{ KN}$

Load on beam = $69 / 5 = 13.8 \text{ KN/m}$

Self-weight of beam = $0.23 \cdot 0.6 \cdot 25 = 3.45 \text{ KN/m}$

Total load = $13.8 + 3.45 = 17.25 \text{ KN/m}$

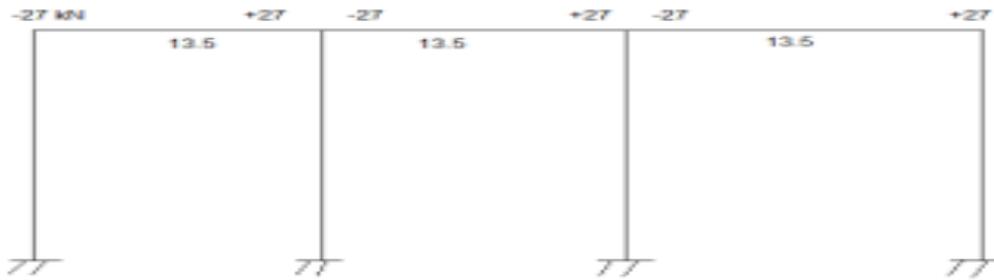

Fig 4 : Loads

DESIGN OF SLAB

Dimensions=4m * 5m, Slab thickness = 150mm
 Self-weight=0.15*1*1*25=3.75kN/m
 Superimposed load=2.8kN/m² then Total load =6.55 kN/m² => W_u=1.5*6.55=9.825 kN/m²
 D =150-20-8/2=126mm, I_x = 4+0.126 = 4.126m, I_y = 5+0.126=5.126m => I_y/ I_x = 1.0406
 $\alpha_x = 0.039$, $\alpha_y=0.03$ => $M_{ux} = \alpha_x w_u l_x^2 = 0.039*9.825*4.126^2 = 9.298kNm$
 $M_{uy} = \alpha_y w_u l_x^2 = 0.03*9.825*4.126^2 = 7.152kNm$
Effective depth : $d_{eff}=9.298*10^6/0.138*20*1000 =58.04$ mm < 126mm (SAFE) Under R.F.

REINFORCEMENT: For short span (middle strip):
 $A_{stx} = 0.36f_{ck}b x_u/0.87f_y = 0.36*20*1000*0.48*126/0.87*415$
 $A_{stx} = 904.56$ mm², Use 8mm Φ bars = spacing = $\pi/4 * 8^2*1000/904.56 = 55$ mm
 Hence provide 8 mm Φ @ 55mm c/c

For long span (middle strip):-
 $7.152*10^6 = 0.87*f_y*A_{sty} (50-415A_{st}/20*1000) => A_{sty} = 500$ mm²
 Hence provide 8mm Φ @ 100mm c/c and 8mm Φ @ 280mm c/c in Min. area of steel

CHECK FOR SHEAR AND DEVELOPMENT LENGTHS

For shorter span :
 S.F. @ longer edge = $w_u l_x r / (2+r) = 6550*4.926*1.0406/(2+1.0406) = 11.042$ KN
 Nominal shear stress @ longer edges = $1.5*11042/1000*126 = 0.131$ N/mm²
 A_{st} at support of short span = $1000 * \pi/4*8^2/110 = 456.9$ mm²
 $M=0.87 * f_y A_{st} (d-0.42x_u) = 0.87*415 * 456.9(126-0.42*22.88) = 19.2$ kNm
 $L_o = 230/2 -20 = 95$ mm => $1.3* M/V + L_o > 47 \Phi$
 $1.3*19.2/11.042*1.5 +95 = 1601 > 376$ mm (SAFE)

For longer span: Factored SF=1/3 $w_u l_x = 1/3*(6550*1.5)*4.926=16131$
 Nominal shear stress, $\tau_v=16131/1000*126=0.128$ N/mm²
 $a_{st}= 1000*4*8^2/200 = 251.5$ mm²
 $x_u = 0.87*415*251.5/0.36*20*1000 = 12.58$ mm
 $M=0.87*415*251.5(126-0.42*12.58) = 10.96$ kNm
 $1.3*10.96/16.131+95 = 978 > 47\Phi = 376$ (SAFE)

TORSIONAL REINFORCEMENT:

Size of mesh= $l_x/5=4.126/5=0.9852$ m from centre of support
 = $(0.23/2) + 0.9852=1.1002$ m from support
 Area of torsional reinforcement= $(3/4) A_{st x} = (3/4)904.56=678.42$ mm²
 Use 8 mm Φ @ spacing = $(1000*\pi/4*8^2)/678.42=74$ mm/cc.

Check for development length:

M.R offered by 8 mm Φ bars @ 140 mm c/c
 $M_1 = 0.87*415*(\pi/4)*8^2*1000/140(126-(4415*\pi/4882*8^2*1000/140)/20*1000)$
 $M_1=15.367$ KNM, $V =30.11$ KN
 $Ld \leq 1.3M_1/V + L_o$
 $=> (0.87*415*8/4*1.2*1.6) \leq (15.367*10^6/30.11*10^3)=510.36=> \Phi \leq 14.11$ mm (SAFE)

The code requires that bars must be carried into the supports by at least $L_d/3 = 510/3=170$ mm.

Check for deflection:

$L/D = \alpha\beta\gamma\delta\lambda$, $\alpha = 26$ for continuous beam , $\beta = 1$ for $L < 10$ m
 $P_t = (A_{st}/bd)*100 = (100*\pi/4*8^2*1000/70)/1000*126 = 0.5790$

$\gamma = 1.15$ for $p_t = 0.57\%$ and $\sigma_s = 240$ MR, $\delta=1, \lambda=1$
 $L/D = 29.9$, Actual $L/d = 4800/126 = 38.09$ [SAFE]

12. DESIGN OF BEAMS
T-BEAM

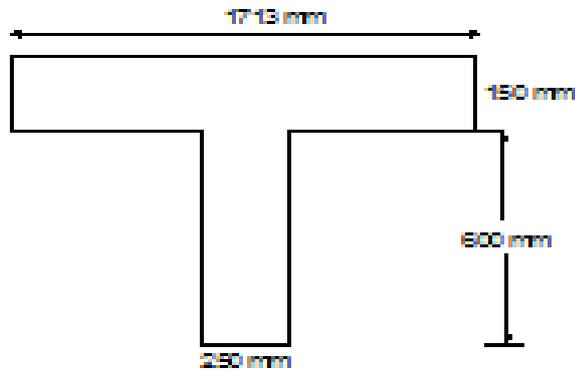

Fig 5 : T-beam

Applied movement = 35.94 KNm

Factored movement = $1.5 * 35.94 = 53.91$ KNm

$L_0 = 0.7 * 5 = 3.5$ m, $d = 750 - 50 = 700$ mm

$b_f = (l_0/6) + b_w + 6D_f = 1713$ mm

Assume $x_u = D_f$

$M_u = 0.36 * 20 * (1713) * 150 (700 - 0.42 * 150) = 1178.5$ KNm

$X_u < D_f$

$M_u = 0.87 f_y A_s (d - f_y A_{st} / f_{ck} b_f) \Rightarrow 53.91 * 10^6 = 0.87 * 415 * A_{st} [700 - (415 * a_{st} / 20 * 1713)] \Rightarrow A_{st} = 222.07$ mm²

use 12 mm \emptyset bars, No. of bars = $(222.07 / (\pi/4) * 12^2) = 2$ bars.

Side face reinforcement: Deep beam (i.e $D = 750$ mm) provides 2-12 mm \emptyset bars on each face.

Check for shear:-

$S_f = 43.125$ kN, $v_u = 1.5 * 43.125 = 64.687$ kN

$T_u = v_u / b_w d = 64.6875 * 10^3 / 230 * 700 = 0.401$ N/m²

$100 A_{st} / b_w d = 100 * 222.07 / 230 * 700 = 0.137$ From $I_s - 456$, pg 73, $T_c = 0.26$ N/mm²

$T_v > T_c$ Shear reinforcement is necessary.

$V_{us} = 64.687 * 10^3 - 0.36 * 230 * 700 = 6.727$ kN

Use 2 legged 8mm \emptyset stirrups

$S_v = (0.87 * 415 * 100.53) / 0.4 * 230 = 394.52$ mm

Max spacing in y = $0.75d = 525$ mm (> 394.52 mm) (safe)

L-Beam Design

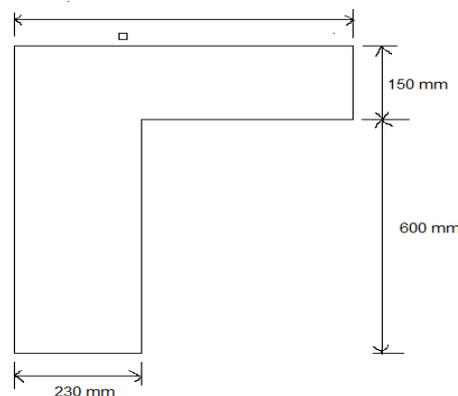

Fig 6 : L-Beam

$D_f = 150$ mm, $b_w = 230$ mm, Effective depth = $750 - 50 = 700$ mm

Factored moment = 53.91 KNm = m_v

$$b_f = L_o / 12 + b_w + 3D_f$$

$$L_o = 0.7(4.8) = 2.8 \text{ m}, b_f = 972 \text{ mm}$$

Assume $x_v = D_f$

$$M = 0.36 * 20 * 972 * 150(700 - (0.42 * 150)) \Rightarrow 682.63 * 10^6 \text{ N mm} = 682.63 \text{ N m} > m_v$$

So $x_v < D_f$

$$53.91 * 10^6 = 0.87 * 415 * A_{st} * 700 (1 - (415/20) * (A_{st}/700 * 971)) \Rightarrow A_{st} = 214.7 \text{ mm}^2$$

Use 12 mm Φ , No. of bars = $214 / ((\pi/4) * 12^2) = 2$, hence Use 2-12 mm Φ bars

Shear reinforcement:

Using 2 legged 8MM stirrups (max spacing = 0.75 d = 525 mm)

$$A_s = 2 * \pi / 4 * 8^2 = 100.53$$

$$S V = (0.87 * 415 * 100.53) / 0.4 * 230 = 390 \text{ mm}$$

SIDE FACE REINFORCEMENT:

A_{st} provide @ 2-12 mm Φ Bars on each face

13. DESIGN OF COLUMNS AXIALLY LOADED COLUMN:

Total weight of column = 81Kn

Loads coming from the beam:

X-X	<u>Y-Y</u>
43.125 + 83/2	84.05KN
= 84.625KN	

$$\text{Total load} = 1.5 (81 + 84.625 + 84.05) = 374.5125 \text{ KN}$$

$$P_u = 374.5125 = 0.45 * 20(300 * 600 - A_{st}) + 0.67 * 415 * A_{st} \Rightarrow A_{st} = 768 \text{ MM}^2$$

$$\text{Min area of reinforcement} = 0.8/100 * 300 * 600 = 1440 \text{ m}^2$$

Use 16 mm Φ bars then No. of bars = $1440 / (\pi/4 * 16^2) = 8$ nos

Use 8-16mm Φ bars and 6mm Φ lateral ties @ 250 mm c/c

14. UNIAXIALLY LOADED COLUMN:

Size of the column = 300*600, Height of the column = 9m, Total weight of column = $0.18 * 9 * 25 = 81 \text{ KN}$

Load coming from beams:

X-X	Y-Y
43.125KN	42.55KN

$$\text{Total factored load} = 1.5 * (43.125 + 42.55 + 81) = 250.0125 \text{ KN}$$

$$\text{Factored moment} = 1.5 * 35.94 \text{ KNm} = 53.91 \text{ KNm}$$

$$P_u / (f_{ck} * b * d) = (250.0125 * 10^3) / (20 * 300 * 600) = 0.069$$

$$M_u / (f_{ck} * b * d^2) = 0.024, p / f_{ck} = 0.045, \% \text{ of steel} = 0.9\%, 100 A_{st} / b * D = 0.9 \Rightarrow A_{st} = 1608.5 \text{ mm}^2$$

Provide 16mm Φ bars then No of bars = $1608.5 / \pi / 4 * 16^2 = 8$ no

Provide 8-16mm Φ bars and Provide 6mm Φ @ 250mm c/c lateral ties.

15. DESIGN OF FOOTING:

SBC = 25 t/m² = 250 kN/m², Load P = 374.5 Kn, Self weight = 10%, P = 37.45 kN then Total load = 411.95 kN

$$\text{Footing area} = \text{total load} / \text{SBC} = 411.95 / 250 = 1.6475 \text{ m}^2$$

Provide sides $\approx 1.3 \text{ m} * 1.3 \text{ m}$ Column size = $0.3 * 0.6 \text{ m}^2$

$$L_x = 1.3 - 0.3 = 1 \text{ m}, L_y = 1.3 - 0.6 = 0.7 \text{ m}, \text{Net upward pressure}, P = 411.95 / (1.3 * 1.3) = 243.76 \text{ kN/m}^2$$

$$M_x = P * B * (L_x)^2 / 8 = 243.76 * 1.3 * 1^2 / 8 = 39.61 \text{ kNm}$$

$$M_y = P * B * (L_y)^2 / 8 = 243.76 * 1.3 * 0.7^2 / 8 = 19.041 \text{ kNm}$$

$$M_{\text{max}} = 39.61 \text{ kNm}$$

Depth of footing:

$$d = \sqrt{M / (0.138 * f_{ck} * b)} = \sqrt{(39.61 * 10^6) / (0.138 * 20 * 1000)} = 119.79 \text{ mm} \Rightarrow d \approx 120 \text{ mm}$$

But min. Depth of foundation D = 500mm, d = 450mm.

Reinforcement:

$$M = 0.87 * f_y * A_{st} * [d - (f_y * A_{st} / f_{ck} * b)]$$

$$39.61 * 10^6 = 0.87 * 415 * A_{st} * [450 - (415 * A_{st} / 20 * 1000)] \Rightarrow A_{st} = 246.6 \text{ mm}^2, \text{hence use 12 mm } \Phi \text{ bars,}$$

Spacing = $\pi * 12^2 / (4 * 247) = 293.4 \text{ mm}$ then Use 12 mm Φ bars @ 300 c/c spacing.

Check for one way shear:

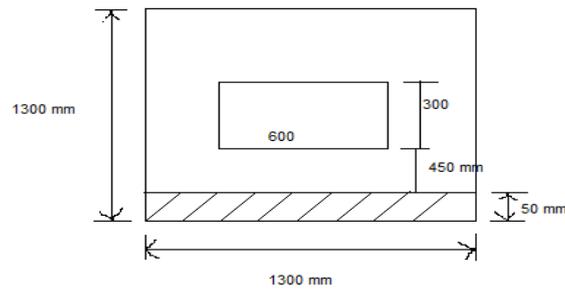

Fig 7 : One way shear

$V_u = q_0(\text{hatched area}) \Rightarrow V_u = 250 * (0.05 * 1.3) = 16.25 \text{ kN}$
 $T_V = V_u / Bd = 16.25 / (1.3 * 0.450) \Rightarrow 0.27 \text{ kN/m}^2$
 $100A_{st} / bd = 0.42 \Rightarrow T_c = 0.41 > T_V$. SAFE in one way shear.

Check for two way shear:

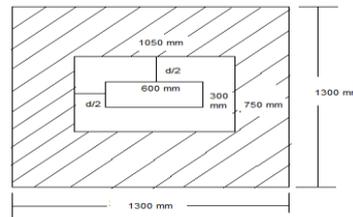

Fig 8 : One way shear

$V_u = q_0(\text{hatched area}) = 250(0.9025) = 225.625 \text{ kN}$
 $T_V = V_u / (\text{perimeter Along dark line}) \Rightarrow T_V = 225.625 / (2 * (0.75 * 1.05)) = 0.625 \text{ kN/m}^2$
 $T_c = 0.25 \sqrt{f_{ck}} = 1.118 > T_V$ safe in two way shear

XII. Results and Discussion

Actually movie theatre total height of columns is 9 m as the breadth of theatre is 19.24 m it will be difficult to provide beams. So roof truss should be designed for this theatre using analysis of STAADD PRO and checked all design of columns, beams, footings, portal frames using LSM.

17. CONCLUSIONS: Generally all cinema theatres should not be provided roof truss but based on the dimensions of hall we have to provide the roof truss.

18. FUTURE WORK: This work will be done extended for Estimation of costing, valuation and quantity survey.

Nomenclature:

- A - Area
- b - Effective width of the slab
- b_f - Effective width of the flange
- b_w - Breadth of web or rib
- D - Overall depth of beam or slab or diameter of column
- D_f - Thickness of the flange

DL	-	Dead Load
d	-	Effective depth of beam or slab
d	-	Depth of compression reinforcement from the highly compressed face
E_C	-	Modulus of elasticity of concrete
EL	-	Earthquake Load
E_S	-	Modulus of elasticity of steel
e	-	Eccentricity
f_{ck}	-	Characteristic cube compressive strength of concrete
f_y	-	Characteristic strength of steel
f_α	-	Modulus of rupture of concrete (Flexural tensile strength)
f_{ct}	-	Splitting tensile strength of concrete
f_d	-	Design strength
H_w	-	Unsupported height of wall
H_{we}	-	Effective height of wall
I_{ef}	-	Effective Moment of Inertia
I_{gr}	-	Moment of Inertia of the gross section excluding reinforcement
I_r	-	Moment of Inertia of cracked section
K	-	Stiffness of member
k	-	Constant (or) Coefficient of factor
L_d	-	Development length
LL	-	Live load (or) imposed load
L_w	-	Horizontal distance between centres of lateral restraint
l	-	Length of column
l_{ef}	-	Effective span of beam or slab or effective length of column
l_{ex}	-	Effective length about x-x axis
l_{ey}	-	Effective length about y-y axis
l_n	-	Clear span, face to face of supports
l_n'	-	l_n for shorter of the two spans at right angles
l_x	-	Length of shorter side of slab
l_y	-	Length of longer side of slab
l_o	-	Distance between points of zero moments in a beam
l_1	-	Span in the direction in which moments are determined, centre to centre of supports
l_2	-	Span transfer to l_1 , centre to centre of supports
l_2'	-	l_2 for the shorter of the continuous spans
M	-	Bending Moment
m	-	Modular ratio
n	-	Number of samples
P	-	Axial load on a compression member
q_{au}	-	Calculated maximum bearing pressure of soil
r	-	Radius
s	-	Spacing of stirrups (or) standard deviation
T	-	Torsional Moment
t	-	Wall thickness
V	-	Shear Force
W	-	Total load
WL	-	Wind load
w	-	Distributed load per unit area
w_d	-	Distributed dead load per unit area
w_l	-	Distributed live (imposed) load per unit area
x	-	Depth of neutral axis
Z	-	Modulus of section
z	-	Lever arm
α, β	-	Angle (or) ratio
γ_r	-	Partial safety factor for load
γ_m	-	Partial safety factor for material
τ_c	-	Shear stress in concrete
$\tau_{c \max}$	-	Maximum shear stress in concrete with shear Reinforcement
τ_v	-	Nominal shear stress
ϕ	-	Diameter of bar
