**Abstract:** In this paper we investigate prime labeling for some graphs related to an octopus graph. We discuss prime labeling in the context of some graph operations namely duplication, fusion, switching in an octopus graph  $O_n$ .

**Keywords:** Prime Labeling, Prime Graph, Octopus Graph, Duplication, Fusion, Switching, Coloring.

### I. Introduction

In this paper, we consider only simple, finite, undirected and non – trivial graph  $G = (V(G), E(G))$  with the vertex set  $V(G)$  and the edge set  $E(G)$ . For notations and terminology we refer to Bondy and Murthy[1]. The notion of a prime labeling was introduced by Roger Entringer and was discussed in a paper by Tout. A(1982 P 365 – 368)[8]. Many researchers have studied prime graph for example in Fu. H(1994 P 181 – 186)[4] have proved that the path  $P_n$  on  $n$  vertices is a prime graph. In Deretsky. T(1991 P 359 – 369)[3] have proved that the Cycle  $C_n$  on  $n$  vertices is a prime graph. Lee. S(1998 P 59 – 67)[6] have proved that Wheel  $W_n$  is a prime graph iff.  $n$  is even. In [7] S. Meena and K. Vaithilingam have proved the prime labeling for some Fan related graphs. For latest survey on graph labeling we refer to [5] (Gallian. J. A., 2009). Vast amount of literature is available on different types of graph labeling and more than 1000 research papers have been published so far in past four decades. In this paper, we investigate the prime labeling for some an octopus graph and its some new graph operations.

### II. Preliminary Definitions

#### Definition [7]

Let  $G = (V(G), E(G))$  be a graph with  $p$  vertices. A bijection  $f : V(G) \rightarrow \{1, 2, \dots, p\}$  is called a *prime labeling* if for each edge  $e = uv$ ,  $\gcd\{f(u), f(v)\} = 1$ . A graph which admits prime labeling is called a *prime graph*.

#### Definition [7]

*Duplication* of a vertex  $v_k$  of a graph  $G$  produces a new graph  $G_1$  by adding a vertex  $v_k'$  with  $N(v_k') = N(v_k)$ . In other words a vertex  $v_k'$  is said to be a duplication of  $v_k$  if all the vertices which are adjacent to  $v_k$  are now adjacent to  $v_k'$  also.

#### Definition [7]

Let  $u$  and  $v$  be two distinct vertices of a graph  $G$ . A new graph  $G_1$  is constructed by *identifying(fusing)* two vertices  $u$  and  $v$  by a single vertex  $x$  is such that every edge which was incident with either  $u$  or  $v$  in  $G$  is now incident with  $x$  in  $G_1$ .

#### Definition [7]

A *vertex switching*  $G_v$  of a graph  $G$  is obtained by taking a vertex  $v$  of  $G$ , removing all the entire edges incident with  $v$  and adding edges joining  $v$  to every vertex which are not adjacent to  $v$  in  $G$ .

#### Definition [2]

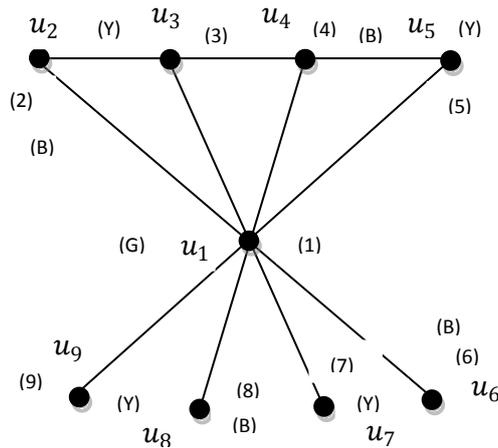

A  $k$  – coloring of a graph  $G = (V, E)$  is a function  $c : V \rightarrow C$ , where  $|C| = k$ . (Most often we use  $C = [k]$ ). Vertices of the same color form a color class. A coloring is *proper* if adjacent vertices have different colors. A graph is  $k$  – *colorable* if there is a proper  $k$  – coloring. The chromatic number  $\chi(G)$  of a graph  $G$  is the minimum  $k$  such that  $G$  is  $k$  – colorable.

### III. Prime Labeling For Some An Octopus Related Graphs

#### 3.1. Octopus Graph

An *Octopus graph*  $O_n$ , ( $n \geq 2$ ) can be constructed by a fan graph  $F_n$ , ( $n \geq 2$ ) joining a star graph  $K_{1,n}$  with sharing a common vertex, where  $n$  is any positive integer. i.e.,  $O_n = F_n + K_{1,n}$ .

**Example 3.2.**

**Figure 3.1.** An octopus graph  $O_4$ .

**Theorem 3.3.** An octopus graph  $O_n$  admits prime graph, where  $n$  is any positive integer.

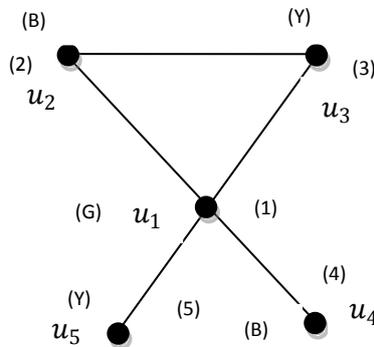

**Proof.** Let  $G$  be an octopus graph  $O_n$ . Let  $\{u_1, u_2, \dots, u_{2n+1}\}$  be the vertices of  $O_n$ . Let  $E(O_n)$  be the edges of an octopus graph where  $E(O_n) = \{u_1 u_i / 1 \leq i \leq 2n + 1\} \cup \{u_i u_{i+1} / 2 \leq i \leq n\}$ . Here  $|V(O_n)| = 2n + 1$ , where  $n$  is any positive integer.

Define a labeling  $f : V(O_n) \rightarrow \{1, 2, \dots, 2n + 1\}$  as follows.

$$f(u_i) = i \text{ for } 1 \leq i \leq 2n + 1$$

Clearly vertex labels are distinct. Then for any edge  $e = u_1 u_i \in O_n$ ,  $\gcd(f(u_1), f(u_i)) = \gcd(1, f(u_i)) = 1$  for  $i = 1, 2, \dots, n, n + 1, \dots, 2n + 1$  and for any edge  $e = u_i u_{i+1} \in O_n$ ,  $\gcd(f(u_i), f(u_{i+1})) = 1$  for  $2 \leq i \leq n$ . Since it is consecutive positive integers. Then  $f$  admits prime labeling. Thus  $O_n$  is a prime graph.

**Example 3.4.**

**Figure 3.2.** Prime labeling for  $O_2$ .

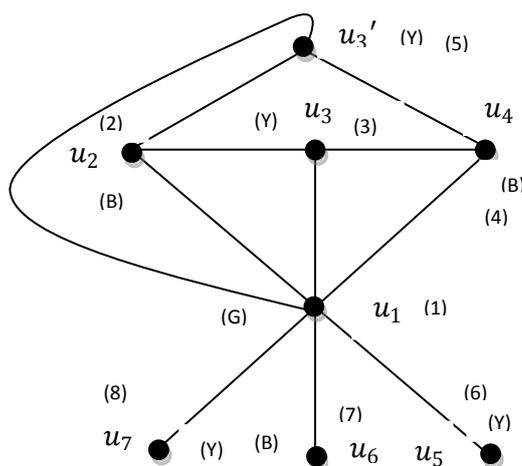

**Theorem 3.5.** The graph obtained by duplicating a vertex  $u_k$  to  $u_k'$  of an octopus graph  $O_n$  is a prime graph, where  $n$  is any positive integer.

**Proof.** Let  $G$  be an octopus graph  $O_n$ . Let  $u_k$  be the vertex of an octopus graph  $O_n$ ,  $u_k'$  be its duplicated vertex and  $G_k$  be the graph resulted due to duplication of the vertex  $u_k$  in  $O_n$ , where  $n$  is any positive integer. Let  $u_k'$  be the duplication of  $u_k$  in  $G_k$ . Then  $|V(G_k)| = 2n + 2$ . We define a labeling  $f : V(G_k) \rightarrow \{1, 2, \dots, 2n + 2\}$  as follows.

$$\begin{aligned} f(u_i) &= i && \text{for } 1 \leq i \leq n + 1 \\ f(u_i) &= i + 1 && \text{for } n + 2 \leq i \leq 2n + 1 \\ f(u_3) &= 5 \end{aligned}$$

Clearly vertex labels are distinct. Then  $f$  admits prime labeling. Thus  $G_k$  is a prime graph.

**Example 3.6.**

**Figure 3.3.** Duplication of  $u_3$  in  $O_3$ .

**Theorem 3.7.** The graph obtained by duplication of a pendant vertex  $u_k$  to  $u_k'$  of an octopus graph  $O_n$  is a prime graph, where  $n$  is any positive integer.

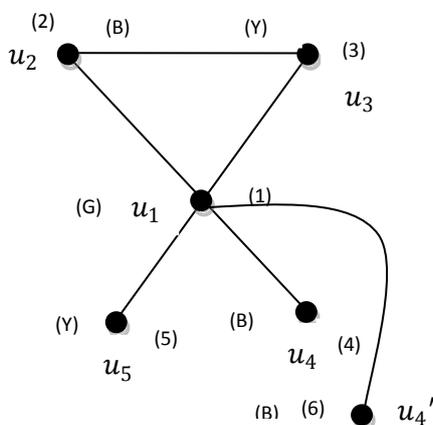

**Proof.** Let  $G$  be an octopus graph  $O_n$ . Let  $u_k$  be the pendant vertex of an octopus graph  $O_n$ ,  $u_k'$  be its duplicated pendant vertex and  $G_k$  be the graph resulted due to duplication of the pendant vertex  $u_k$  in  $O_n$ , where  $n$  is any positive integer. Let  $u_k$  be the duplication of  $u_k$  in  $G_k$ . Then  $|V(G_k)| = 2n + 2$ . We define a labeling  $f : V(G_k) \rightarrow \{1, 2, \dots, 2n + 2\}$  as follows.

$$f(u_i) = i \quad \text{for } 1 \leq i \leq 2n + 1$$

$$f(u_k) = 2n + 2$$

Clearly vertex labels are distinct. Then  $f$  admits prime labeling. Thus  $G_k$  is a prime graph.

**Example 3.8.**

**Figure 3.4.** Duplication of a pendant vertex  $u_4$  in  $O_2$ .

**Theorem 3.9.** The graph obtained by duplicating of an apex vertex  $u_1$  to  $u_1'$  in an octopus graph  $O_n$  is a prime graph, where  $n$  is any positive integer.

**Proof.** Let  $G$  be an octopus graph  $O_n$ . Let  $u_k$  be an apex vertex of an octopus graph  $O_n$ ,  $u_k'$  be its duplicated of an apex vertex and  $G_k$  be the graph resulted due to duplication of an apex vertex  $u_k$  in  $O_n$ , where  $n$  is any positive integer. Let  $G_k$  be the graph obtained by duplicating an apex vertex  $u_1$  in  $O_n$ , where  $n$  is any positive integer. Let  $u_1'$  be the duplication of an apex vertex  $u_1$  in  $G_k$ . Then  $|V(G_k)| = 2n + 2$ .

We define a labeling  $f : V(G_k) \rightarrow \{1, 2, \dots, 2n + 2\}$  as follows.

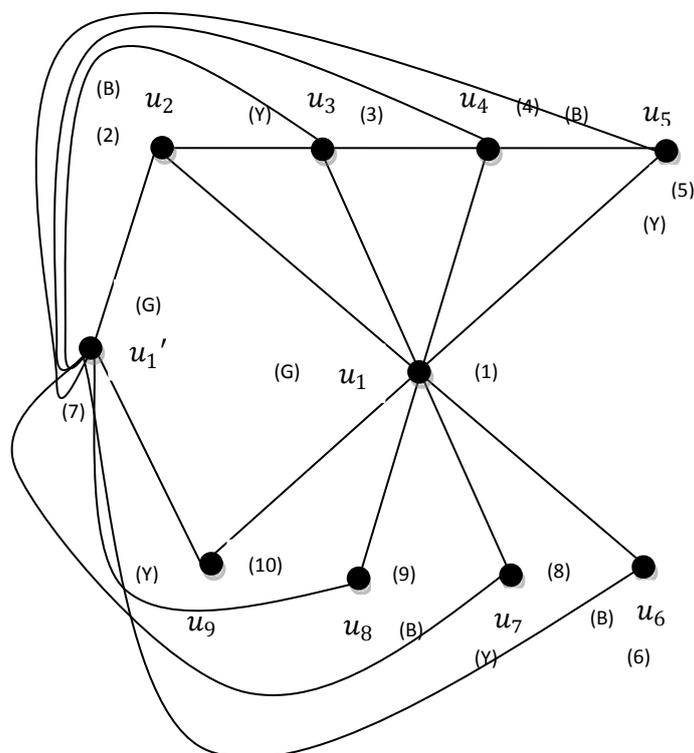

$$f(u_i) = i \quad \text{for } 1 \leq i \leq 2n - 2$$

$$f(u_i) = i + 1 \quad \text{for } 2n - 1 \leq i \leq 2n + 1$$

$$f(u_1') = 7$$

Clearly vertex labels are distinct. Then  $f$  admits prime labeling. Thus  $G_k$  is a prime graph.

**Example 3.10.**

**Figure 3.5.** Duplication of an apex vertex  $u_1$  in  $O_4$ .

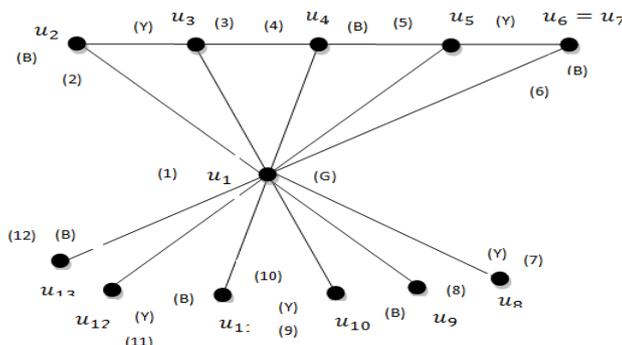

**Theorem 3.11.** The graph obtained by fusing the vertex  $u_i$  with  $u_k$  (where  $d(u_i, u_k) \geq 3$ ) in an octopus graph  $O_n$  is a prime graph, where  $n$  is any positive integer.

**Proof.** Let  $V(O_n) = \{u_1, u_2, \dots, u_{2n+1}\}$ .  $E(O_n) = \{u_1u_i/2 \leq i \leq 2n+1\} \cup \{u_iu_{i+1}/2 \leq i \leq n\}$ . Let  $G_k$  be the graph obtained by fusing the vertex  $u_i$  with  $u_k$  in  $O_n$ . Here  $|V(G_k)| = 2n$ . Define a labeling  $f: V(G_k) \rightarrow \{1, 2, \dots, 2n\}$  as follows

$$\begin{aligned} f(u_i) &= i && \text{for } 1 \leq i \leq n-1 \\ f(u_i) &= i-1 && \text{for } n+2 \leq i \leq 2n+1 \\ f(u_6) &= 6 = f(u_7) \end{aligned}$$

Then  $f$  admits prime labeling. According to this pattern the vertices are labeled such that for any edge  $e = u_iu_k \in G_k$ ,  $\gcd(f(u_i), f(u_k)) = 1$ . Clearly vertex labels are distinct. Thus we proved that the graph under consideration admits prime labeling. That is, the graph obtained by fusing (identifying) any two vertices  $u_i$  and  $u_k$  (where  $d(u_i, u_k) \geq 3$ ) of an octopus graph  $O_n$  is a prime graph.

**Example 3.12.**

**Figure 3.6.** Fusion of  $u_6$  and  $u_7$  in  $O_6$ .

**Theorem 3.13.** The graph obtained by identifying any two pendant vertices  $u_i$  and  $u_k$  (where  $d(u_i, u_k) \geq 3$ ) of an octopus graph  $O_n$  is a prime graph, where  $n$  is any positive integer.

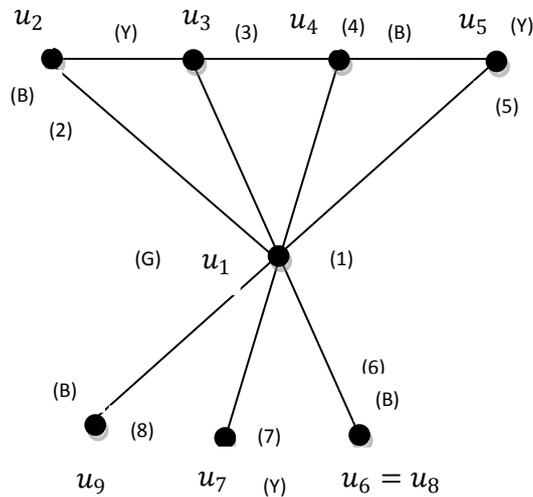

**Proof.** Let  $V(O_n) = \{u_1, u_2, \dots, u_{2n+1}\}$ .  $E(O_n) = \{u_1u_i/2 \leq i \leq 2n + 1\} \cup \{u_iu_{i+1}/2 \leq i \leq n\}$ . Let  $G_k$  be the graph obtained by identifying a pendant vertices  $u_i$  and  $u_k$  in an octopus graph  $O_n$ . Here  $|V(G_k)| = 2n$ . For  $n$  and  $k$  are both odd or even.

Define a labeling  $f: V(G_k) \rightarrow \{1, 2, \dots, 2n\}$  as follows

$$\begin{aligned} f(u_i) &= i && \text{for } 1 \leq i \leq n + 3 \\ f(u_6) &= 6 = f(u_8) \\ f(u_i) &= i - 1 && \text{for } i = 2n + 1 \end{aligned}$$

Then  $f$  admits prime labeling. According to this pattern the vertices are labeled such that for any edge  $e = u_iu_k \in G_k$ ,  $\gcd(f(u_i), f(u_k)) = 1$ . Clearly vertex labels are distinct. Thus we proved that the graph under consideration admits prime labeling. That is, the graph obtained by fusing (identifying) any two pendant vertices  $u_i$  and  $u_k$  (where  $d(u_i, u_k) \geq 3$ ) of an octopus graph  $O_n$  is a prime graph.

**Example 3.14.**

**Figure 3.7.** Fusion of the pendant vertices  $u_6$  and  $u_8$  in  $O_4$ .

**Theorem 3.15.** The graph obtained by identifying an apex vertex  $u_1$  and  $u_k$  (where  $d(u_1, u_k) \geq 3$ ) in an octopus graph  $O_n$  is a prime graph, where  $n$  is any positive integer.

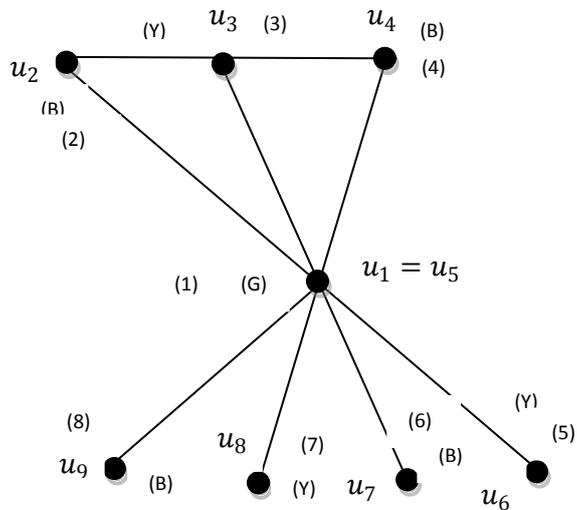

**Proof.** Let  $V(O_n) = \{u_1, u_2, \dots, u_{2n+1}\}$ .  $E(O_n) = \{u_1u_i/2 \leq i \leq 2n + 1\} \cup \{u_iu_{i+1}/2 \leq i \leq n\}$ . Let  $G_k$  be the graph obtained by identifying an apex vertex  $u_1$  and  $u_k$  in an octopus graph  $O_n$ . Here  $|V(G_k)| = 2n$ . For  $n$  and  $k$  are both odd or even.

Define a labeling  $f: V(G_k) \rightarrow \{1, 2, \dots, 2n\}$  as follows

$$\begin{aligned} f(u_1) &= 1 = f(u_5) \\ f(u_i) &= i && \text{for } 2 \leq i \leq n \\ f(u_i) &= i - 1 && \text{for } n + 2 \leq i \leq 2n + 1 \end{aligned}$$

Then  $f$  admits prime labeling. According to this pattern the vertices are labeled such that for any edge  $e = u_1u_k \in G_k$ ,  $\gcd(f(u_1), f(u_k)) = 1$ . Clearly vertex labels are distinct. Thus we proved that the graph under consideration admits prime labeling. That is, the graph obtained by fusing (identifying) an apex vertex and any vertices  $u_1$  with  $u_k$  (where  $d(u_1, u_k) \geq 3$ ) of an octopus graph  $O_n$  is a prime graph.

**Example 3.16.**

**Figure 3.8.** Fusion of  $u_1$  and  $u_5$  in  $O_4$ .

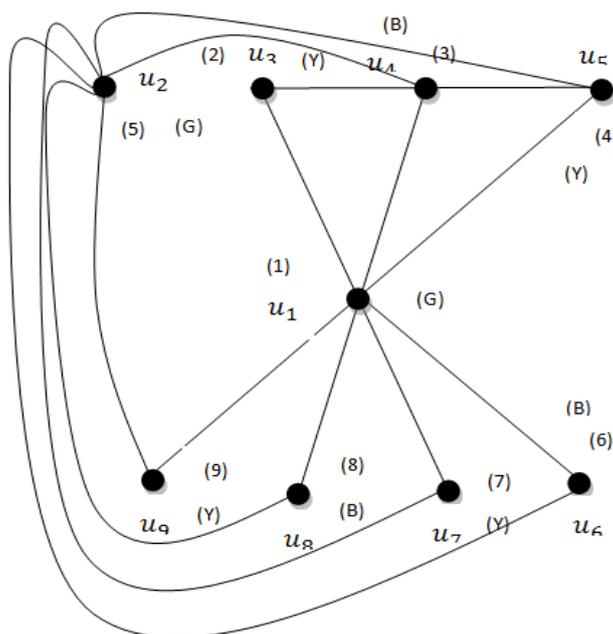

**Theorem 3.17.** The switching of any vertex  $u_k$  in an octopus graph  $O_n$  produces a Prime graph, where  $n$  is any positive integer.

**Proof.** Let  $V(O_n) = \{u_1, u_2, \dots, u_{2n+1}\}$ .  $E(O_n) = \{u_1u_i/2 \leq i \leq 2n+1\} \cup \{u_iu_{i+1}/2 \leq i \leq n\}$ . Let  $G_u$  be the graph obtained by switching any vertex  $u_k$  in  $O_n$ . Here  $|V(G_u)| = 2n+1$ . Define a labeling  $f: V(G_u) \rightarrow \{1, 2, \dots, 2n+1\}$  as follows

$$\begin{aligned} f(u_1) &= 1 \\ f(u_2) &= 5 \\ f(u_i) &= i - 1 \text{ for } 3 \leq i \leq n + 1 \\ f(u_i) &= i \text{ for } n + 2 \leq i \leq 2n + 1 \end{aligned}$$

Then for any edge  $e = u_iu_{i+1} \in G_u$ ,  $\gcd(f(u_i), f(u_{i+1})) = 1$  and for any edge  $e = u_1u_i \in G_u$ ,  $\gcd(f(u_1), f(u_i)) = \gcd(1, f(u_i)) = 1$ . Clearly vertex labels are distinct. Then  $f$  admits prime labeling. Thus  $G_u$  is a prime graph.

**Example 3.18.**

**Figure 3.9.** Switching the vertex  $u_2$  in  $O_4$ .

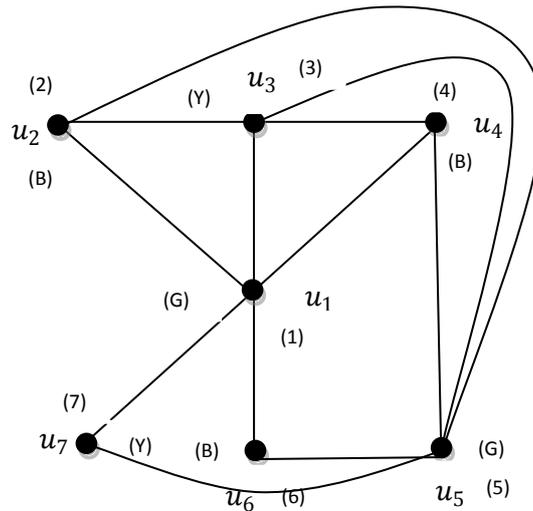

**Theorem 3.19.** The switching of any pendant vertex  $u_k$  in an octopus graph  $O_n$  produces a Prime graph, where  $n$  is any positive integer.

**Proof.** Let  $V(O_n) = \{u_1, u_2, \dots, u_{2n+1}\}$ .  $E(O_n) = \{u_1u_i/2 \leq i \leq 2n+1\} \cup \{u_iu_{i+1}/2 \leq i \leq n\}$ . Let  $G_u$  be the graph obtained by switching any pendant vertex  $u_k$  in  $O_n$ . Here  $|V(G_u)| = 2n+1$ . Define a labeling  $f: V(G_u) \rightarrow \{1, 2, \dots, 2n+1\}$  as follows

$$f(u_i) = i \text{ for } 1 \leq i \leq 2n+1$$

Then for any edge  $e = u_iu_{i+1} \in G_u$ ,  $\gcd(f(u_i), f(u_{i+1})) = 1$  and for any edge  $e = u_1u_i \in G_u$ ,  $\gcd(f(u_1), f(u_i)) = \gcd(1, f(u_i)) = 1$ . Clearly vertex labels are distinct. Then  $f$  admits prime labeling. Thus  $G_u$  is a prime graph.

**Example 3.20.**

**Figure 3.10.** Switching the pendant vertex  $u_5$  in  $O_3$ .

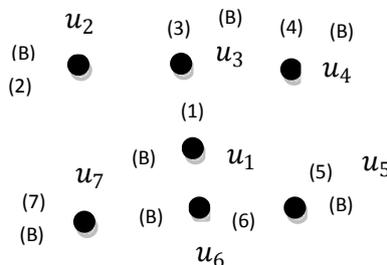

**Theorem 3.21.** The switching of an apex vertex  $u_1$  in an octopus graph  $O_n$  produces a Prime graph, where  $n$  is any positive integer.

**Proof.** Let  $V(O_n) = \{u_1, u_2, \dots, u_{2n+1}\}$ .  $E(O_n) = \{u_1u_i/2 \leq i \leq 2n+1\} \cup \{u_iu_{i+1}/2 \leq i \leq n\}$ . Let  $G_u$  be the graph obtained by switching an apex vertex  $u_1$  in  $O_n$ . Here  $|V(G_u)| = 2n+1$ . Define a labeling  $f: V(G_u) \rightarrow \{1, 2, \dots, 2n+1\}$  as follows

$$f(u_i) = i \text{ for } 1 \leq i \leq 2n+1$$

Clearly vertex labels are distinct. Then  $f$  admits prime labeling. Thus the resulting graph  $G_u$  is a prime graph and it is a disconnected graph.

**Example 3.22.**

**Figure 3.11.** Switching an apex vertex  $u_1$  in  $O_3$ .

#### IV. Conclusion

In this paper we proved that an octopus graph  $O_n$ , duplication of an octopus graph  $O_n$ , fusing of an octopus graph  $O_n$ , switching of an octopus graph  $O_n$  are prime graphs. There may be many interesting prime graphs can be constructed in future.
